POP_{RATER}
WHITE PAPER

What is Crypto Money?

Crypto money is a fully digital, encrypted currency that can be used in exchange transactions.

Today, cryptocurrencies are a phenomenon that has been heard by many people, and has attracted a lot of attention from everyone from heads of state to giant companies. Cryptography is used to verify and securely perform clearing transactions.

Originally, the money spent and transferred with debit cards and credit cards are also virtual currencies, because only the system data changes as a result of these transactions. Crypto coins have the same principle of operation. However, there is a system that is not managed by any authority or government, that is, decentralized, which makes the system more secure.

What is cryptology?

Cryptology is a science of encryption. It is the encryption of data according to a system. Cryptocurrencies are transferred through the creation and decryption of passwords on the medium. Algorithms such as hash functions are used.

History of Crypto Coins

Bitcoin, the first crypto currency, was developed by the person or persons who came up with the code name Satoshi Nakamoto in early 2009. Although it is said to have been developed by Satoshi Nakamato, it was shared as open source software by an unknown person (s). This network runs on a platform with a similar concept to end-to-end encrypted file sharing platforms.

Security of cryptocurrencies

One of the most important problems with payment systems is the possibility of spending the same money twice. The traditional method used to prevent this is to put in a central broker (banks) that keeps track of the transactions made. However, this method means that an authority that can control all the capital intervenes. This reduces reliability.

However, in order for the transaction to take place in a distributed network, each part of the system must give approval. These transactions are done through the blockchain, so every transaction made can be seen by everyone.

All transfer transactions are made with the wallet addresses of the sender and receiver and the amount to be sent. The exchange or shipment transaction must be verified by the sender and then confirmed by the system.

Verification can only be done by miners by solving a cryptographic puzzle. Once a transaction is approved, it cannot be reversed.

How is crypto money produced? What is cryptocurrency mining?

The production of cryptocurrencies is carried out over a distributed system like themselves. So it is user based. Cryptocurrencies have a production limit, so as the amount of cryptocurrencies produced increases, the transactions that need to be solved to produce cryptocurrencies become more difficult.

The production process is through mining, even if there is no physical mining, operations based on solving mathematical problems are performed. In other words, if you have processor power and internet connection, you can undertake the mining task without being assigned by someone.

What are the advantages of cryptocurrencies?

• First of all, since cryptocurrencies do not have any center, they are not dependent on a center when transferring. That's why it's quite simple to transfer cryptocurrencies from one wallet to another. The transfer can be made at any time, 24 hours a day.

• One of the benefits of crypto currencies is that they can be converted into currencies we use in daily life.

• Since crypto coins do not belong to any country, they are not affected by the economic ups and downs in countries. They are completely independent.

• It is impossible to counterfeit cryptocurrencies, but also cannot be copied. Therefore, there is no control problem as this money is fake.

TRC20 Network

• TRC-20 is a token standard based on the implementation of a smart contract when using the TRON network to issue a token.

• All TRC20 tokens follow a set of established rules to exchange and transfer assets, share tokens and be supported by digital wallets.

Advantages of TRC20

Low transfer fee (fee / commission) in the transfer of cryptocurrencies
• Crypto money transfers happen faster.
• Thanks to its widespread use, it is easy to integrate internationally.

WHAT IS POPRATER?

• Poprater is a cryptocurrency produced using TRC-20 infrastructure and technology.
• TRC-20 is one of the most preferred infrastructures with its low transfer fees, fast shipping and international integration.•
It aims to bring the "drawing", a method where people have fun and the lucky ones win, from the past to the present, to the blockchain world with its mobile application.
• Poprater Token is an entertainment platform that offers the opportunity to earn crypto assets with the lottery, and at the same time, users who meet the conditions can organize a lottery.
• Poprater is to provide a simple global currency and a financial infrastructure that reaches millions of people.
• The draw will be made through the mobile application and our website www.poprater.com, and the results will be announced in a transparent manner.

POPRATER TOTAL SUPPLY AND MARKET FUNCTION

• Total Poprater Supply: 1.200.000.000 (billion) pieces
• Investor Support for Mobile Application: 415.000.000 (million) units
• IEO: 100,000,000 (million) units
• Airdrop: 240.000.000 (million) units
• Team: 100,000,000 (million) pieces
• Development: 60.000.000 (million) units
• Staking: 100,000,000 (million) units
• Marketing: 120.000.000 (million) pieces
• Strategic Partnerships: 40.000.000 (million) units
• Consultation: 25.000.000 (million) pieces
